

Release Notes - OutSite Office - Version 2.2.3 (build 27706 / January 2009)

Bug

[\[OUT-126\]](#) - Uninstall script deletes desktop folder all users

OutSite office Uninstall, deletes the desktop folder of all users, if the desktop folder is empty. The desktop reference is now removed from the installation script.

[\[OUT-131\]](#) - Strong password

OutSite Office installation on Vista requires strong passwords. We have changed the database passwords, so they comply with the strong password policy.

When upgrading an existing database, answer [NO] on the question:
"OutSite Database exists, drop Database?"

All necessary changes in the database and in the database connect string in "OutSiteOffice.exe.config", are automatically deployed.

Installation of Microsoft SQL Server 2005 Express is fully supported now, and is the default for new installations of OutSite Office. MSDE is not available anymore, because this is not supported on Vista.

Improvement

[\[OUT-127\]](#) - Error handling OutSite Office.

Enhanced error handling shows extra information if OutSite Office is not starting. For example when active sync is not installed.
